Fluorescence microscopy is an optical microscope that uses fluorescence and phosphorescence instead of, or in addition to, reflection and absorption to study properties of organic or inorganic substances. Fluorescence microscopy has become an essential tool in biology as well as in materials science as it has attributes that are not readily available in other optical microscopy techniques. Olympus, Nikon, Leica and ZEISS are famous for their high quality and precision fluorescence microscopes in the world for the time being. The four players held 37% production market share.
