Frac sand (or fracking sand) refers to sand and similar small materials that are used during the process of hydraulic fracturing, a method for extracting underground Natural Gas Exploration from shale gas formations. Fracking sand is a proppant. A proppant is a material used to prop open the underground cracks from which Natural Gas Exploration is harvested during the fracturing process. These gases include petroleum fluids such as oil, Natural Gas Exploration, and Natural Gas Exploration liquids from rock units (that don't have enough pore space allowing fluids to flow to a well).
