The global FTIR Spectrometer market was valued at 296.04 Million USD in 2021 and will grow with a CAGR of 5.9% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

FT-IR stands for Fourier Transform InfraRed, the preferred method of infrared spectroscopy. In infrared spectrometer, IR radiation is passed through a sample. Some of the infrared radiation is absorbed by the sample and some of it is passed through (transmitted). The resulting spectrum represents the molecular absorption and transmission, creating a molecular fingerprint of the sample. Like a fingerprint no two unique molecular structures produce the same infrared spectrum. This makes infrared spectroscopy useful for several types of analysis. FTIR spectrometers (Fourier Transform Infrared Spectrometer) are widely used in organic synthesis, polymer science, petrochemical engineering, pharmaceutical industry and food analysis. In addition, since FTIR spectrometers can be hyphenated to chromatography, the mechanism of chemical reactions and the detection of unstable substances can be investigated with such instruments. We selected a total of 11 companies as samples. The 11 companies account for about 76% of the industry's market share. We can think that this is a relatively concentrated market, mainly because there is a high technical threshold and brand awareness, so the degree of concentration is high. And these are big companies.
