Geopolymers were developed nearly three decades ago by Davidovits who prepared alumino-silicate materials in alkaline at ambient temperature environments. Geopolymers are a type of inorganic polymer that can be formed at proper temperature by using aluminosilicate precursor material, such as metakaolin or fly ash as source materials and adopting alkali activated technology to form a solid binder that looks like and performs a similar function to OPC. Geopolymer binder can be used in applications to fully or partially replace OPC with environmental and technical benefits, including an 80-90% reduction in CO₂ emissions and improved resistance to fire and aggressive chemicals. In terms of application, geopolymer can be applied in building materials, transportation, automotive, aerospace industries industry and other. Transportation industry accounted for the largest market with about 35.25% of the global consumption for geopolymer in 2015.
