The global Glass Scintillator market was valued at 18.51 Million USD in 2021 and will grow with a CAGR of 1.99% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Glass Scintillator is detecting element for heavy charged particles, gamma rays (electrons) and neutrons. Its average atomic number is higher, so it has a higher stopping power for charged particles. Because it contains boron and lithium, it can be used as a neutron detector with many desirable properties. For example, the characteristics of short optical attenuation time, good temperature performance and high detection efficiency of slow neutrons have aroused great interest of nuclear physics experimenters.
