Green petroleum coke is a carbonaceous solid residue produced by the thermal decomposition of petroleum fractions. It has low metal content and is calcined in rotary kilns to form calcined petroleum coke. During the calcination process, green petroleum coke is heated to increase its electrical conductivity and remove volatile matter, moisture, and other impurities. The calcined petroleum coke is further processed to produce carbon anodes in the required shape and physical characteristics by using anode baking ovens. The quality of the calcined petroleum coke plays a key role in the performance and quality of the anodes. Green and calcined petroleum coke play important roles in various fields. Huge downstream demand drives the production of green and calcined petroleum coke. The main sales markets are in Asia Pacific and North America. After sweeping Asia Pacific, North America, Europe, the Middle East, Africa and South America also have a strong procurement market. The Asia-Pacific region is the largest consumer of green and calcined petroleum coke, with a market share of more than 40% in 2019.
