The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Gum arabic, also known as acacia gum, char gund, char goond, or meska, is a natural gum made of hardened sap taken from two species of the acacia tree; Senegalia (Acacia) senegal and Vachellia (Acacia) seyal. Gum arabic is used primarily in the food industry as a stabilizer. It is edible and has E number E414. Gum arabic is a key ingredient in traditional lithography and is used in printing, paint production, glue, cosmetics and various industrial applications, including viscosity control in inks and in textile industries, although less expensive materials compete with it for many of these roles. While gum arabic is now produced mostly throughout the African Sahel, it is still harvested and used in the Middle East. For example, Arab populations use the natural gum to make a chilled, sweetened, and flavored gelato-like dessert. In this report, we separate the gum arabic (E414) into raw grade gum arabic and refined gum arabic in the data section. At present, the raw grade gum and refined grade gum both are circulated in the market and the end consumers can purchase each kind gum directly. The refined gum players purchase the raw gum from the raw grade gum players and process the refined level and then push the refined gum to the market. In order to avoid duplication of statistics, we separate the gum arabic (E414) into raw grade gum arabic

and refined gum arabic in the data section. While, most of the raw grade gum companies acquire the hand-picked gum from the local farmers of Sudan, Chad and other original place.
