Heart defect closure devices are permanent implants designed to close defects between chambers of the heart or a patent ductus arteriosus. These are self-expandable, self-centering umbrella-like devices. The design and shape of the devices vary, as does their exact mode of deployment. They are implanted in the defect in a cardiac catheterization laboratory, through catheters inserted into either a vein or an artery (transcatheter or percutaneous approach). There are several types of defects, which include atrial septal defect (ASD), persistent patent ductus arteriosus (PDA), ventricular septal defect (VSD), patent foramen ovale (PFO), and left atrial appendage (LAA). Most of these defects are congenital, but can occur after a myocardial infarction or can be the result of a surgical repair of other congenital heart defects. The classification of Heart Defect Closure Devices includes ASD Closure Devices, VSD Closure Devices, PDA Closure Devices, PFO Closure Devices and LAA Closure Devices. And the proportion of Amplatzer PFO Occluder in 2017 is about 33%, and the proportion is in decreasing trend from 2013 to 2017. LAA Closure Devices with the growth rate about 18%, in 2017 the market share is nearly 22%. Heart Defect Closure Devices is widely used in hospitals and clinics. The most proportion of Heart Defect

Closure Devices is used in Hospital, and the proportion in 2017 is 61%. Europe is the largest consumption place, with a consumption market share nearly 30% in 2017. Following Europe, North America is the second largest consumption place with the consumption market share of 27%.
