The hematocrit blood test defines the proportion of red blood cells in the blood. Composition of blood mainly constitutes of white blood cells and red blood cells suspended in virtually clear fluid called serum. The hemoglobin or hematocrit test specifies the percentage of blood by volume that is composed of red blood cells. North America dominated the global hematocrit test market owing to the increasing geriatric population, increase in prevalence of anemia and rising number of surgical procedures in the region. Europe is the second largest market for hematocrit test owing to factors such as rising expenditure in research, increased focus of key players engaged in the manufacturing of medical devices for instruments development in these major economies. Additionally, ever-increasing patient population, well-developed healthcare sector, and high healthcare expenditure by the European nations fuel the market growth.
