Blood clotting or coagulation, is an important process that eliminates excessive bleeding when a blood vessel is damaged. Platelets and proteins work together to stop the bleeding by forming a clot over the injury. Blood clottage is one of the mechanisms that reduce the loss of blood from damaged blood vessels. Hemostats and tissue sealants are used post-surgery or traumatic injury to bind or hold external tissue (skin) as well as internal tissue (blood vessels). Some key types of hemostats and tissue sealants include fibrin sealants, collagen-based compounds, synthetic agents, and tissue adhesive glues such as hydrogels and glutaraldehyde glues. Fibrin sealants have a wide range of medical applications. The recent increase in number of out-patient surgeries is the prime driver for the growth of this market. Since these surgeries help to reduce the overall healthcare expenditure, they are increasingly being preferred by insurance payers to acquire reimbursements for their surgeries. Furthermore, as the out-patient surgeries do not require overnight stays, they are readily available to the patients.
