High-performance liquid chromatography, or HPLC, is a highly versatile technique that separates components of a liquid mixture based on their different interactions with a stationary phase. HPLC is an adaptation of column chromatography. In column chromatography, a column is packed with micro-scale beads called the stationary phase. The stationary phase beads are functionalized with chemical groups that induce an interaction between the bead and the components of a mixture located in the liquid, or mobile phase. As the mixture flows through the column, the components interact with the stationary phase differently.
