Hydrolyzed vegetable protein (HVP) is a flavor enhancer used in processed foods. It is usually produced by acid hydrolysis of soybean, corn, or wheat, which are broken down into amino acids. HVP is also produced by enzyme hydrolysis or by alkaline treatment. It is added to food products such as soup, bouillon cubes, seasonings, spices, beef products, flavorings, veggie burgers, imitation meat products, sauces, gravy, cheese powder, and functional beverages among others. Though HVP is produced chemically, manufacturers consider it to be natural flavoring as it is originally derived from vegetable products. It is also considered as the most sustainable protein ingredients. Increased disposable income and change in lifestyle leading to high demand for convenience food cause increased consumption of HVP, thus driving the market growth.
