A hysteroscope is used to assess the uterus for many reasons such as heavy or abnormal bleeding, a displaced intrauterine device, severe cramping, frequent miscarriages, or problems related to conceiving. Hysteroscopes are used mainly for two purposes-operative and diagnostics. Operative hysteroscopy involves the usage of tiny instruments to remove abnormalities such as polyps and fibroids; diagnostic hysteroscopy is used to evaluate the presence of any abnormalities. The use of hysteroscopes rises among elderly people as conditions associated with the usage of hysteroscopes such as fertility examinations, transcervical sterilizations, and abnormal uterine bleeding are common among the mature female demographic. Thus, the rise in geriatric population increases the market growth.
