The global IGY Polyclonal Antibodies market was valued at 4.05 Million USD in 2021 and will grow with a CAGR of 12.61% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Immunoglobulin Y (abbreviated as IgY) is a type of immunoglobulin which is the major antibody in bird, reptile, and lungfish blood. It is also found in high concentrations in chicken egg yolk. As with the other immunoglobulins, IgY is a class of proteins which are formed by the immune system in reaction to certain foreign substances, and specifically recognize them. IgY antibodies have a different structure from IgG, particularly in the Fc and hinge regions. The affinity maturation process of IgY is also different from IgG. These biological features underlie IgY's competitive advantages over IgG. Shown in the four panels are several comparisons between IgY and IgG. IgY is a hen egg polyclonal antibody. Hen eggs contain more than 450 separate antibodies and when consumed, are not rejected by the human immune system. North America is the largest consumption place, with a consumption market share nearly 37.5% in 2017; Europe is the second largest consumption place with the consumption market share of 30% in 2017.
