The global Image Intensifier Tube market was valued at 741.99 Million USD in 2021 and will grow with a CAGR of 4.36% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

An image intensifier or image intensifier tube is a vacuum tube device for increasing the intensity of available light in an optical system to allow use under low-light conditions, such as at night, to facilitate visual imaging of low-light processes, such as fluorescence of materials in X-rays or gamma rays (X-ray image intensifier), or for conversion of non-visible light sources, such as near-infrared or short wave infrared to visible. They operate by converting photons of light into electrons, amplifying the electrons (usually with a microchannel plate), and then converting the amplified electrons back into photons for viewing. They are used in devices such as night vision goggles. In 2018, the military segment held more than 70% share of the market. In addition, the segment is expected to maintain its dominance throughout the forecast period. Military uses of image intensifier tubes includes night vision devices. Image intensifier tubes are used in night vision goggles, night vision scopes, vehicle mounted night vision systems, among others.
