An in-building cellular enhancement system, commonly implemented in conjunction with a distributed antenna system (DAS), is a telecommunications solution which is used to extend and distribute the cellular signal of a given mobile network operator (hereafter abbreviated as an MNO) within a building.In-Building Wireless operators face an increasing need for more comprehensive coverage, stronger signal, faster traffic, which enable remote deployment and scalability according to the demand. In-building wireless coverage has become the ?fourth utility? in enterprise office space, along with water, power, and wireline voice/data service. Connecting is no longer a luxury, and the necessity is driving demand for constant coverage. Many employees use their cellular devices as their primary means of communication, and they use their personal devices at work. It`s rare to see an enterprise user with a corporate mobile account with one operator. So, an office space must support service from the major wireless carriers.
