In vitro diagnostic instruments are instruments that intended for use in diagnosis of disease or other conditions, including a determination of the state of health, in order to cure, mitigate, treat, or prevent disease or its sequelae. Such products are intended for use in the collection, preparation, and examination of specimens taken from the human body. IVDs are highly sensitive to changes in their packaging environment. Moisture is typically the biggest degradation threat to IVDs. Oxygen and hydrocarbons are also a threat to IVD devices. When moisture, oxygen, and/or hydrocarbons are inside the packaging they could result in inaccurate and inconsistent test results?.
