An inductor, also called a coil, choke or reactor, is a passive two-terminal electrical component that stores energy in a magnetic field when electric current flows through it. Inductors are components designed to resist changes and are utilized for the storage of energy in form of magnetic field and is referred to as passive electronic component. Inductor is an electric device consisting of single or multiple loops of wire and typically has two terminals. Change in magnetic field induces voltage that opposes the field-producing current which is known as inductance. An inductor is connected to a circuit to increase the inductance to a desired value. The inductance of an inductor is dependent on the number of turns/loops of copper wire around the metal/air and the radius of the copper coil.
