Abstracts

The global Inorganic Scintillators market was valued at 246.41 Million USD in 2021 and will grow with a CAGR of 5.17% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Inorganic Scintillators are crystals grown in high temperature furnaces and are made of Alkali Halides (i.e., NaI, CsI) or Oxides (i.e., BGO), etc. They have scintillation properties by virtue of their crystalline structure. This structure creates the energy bands between which electrons can jump up to higher energy levels by excitation through ionizing radiation or down to lower energy levels by de-excitation through the emission of (visible) photons. The result is known as the scintillation effect. Some crystals need activators to enable scintillation emission in the visible part of the spectrum. An example of such an activator is Thallium (Tl), which is used in the best known and most frequently used Inorganic Scintillator: NaI(Tl). The market volume of inorganic scintillators is related to downstream demand and global economy. Although there will always be some uncertainties in the global economy in the following years, people's requirement of health and safety is increased, it is surely forecasted that the market of inorganic scintillators is still promising.
