Insufflator is the device used for check and surgery of ventral and heart of the body. Insufflator generally employs carbon dioxide (CO₂) to generate and maintain the intraperitoneal gas in order to expand the operative field. According to the USA FDA's regulation, "a laparoscopic insufflator is a device used to facilitate the use of the laparoscope by filling the peritoneal cavity with gas to expand it". An insufflator usually consists of host, verses needle, gas (such as CO₂) filter, heating unit and power line etc. Most sales occurred domestically (except China), import and export of each region is not too much. Low and middle flow insufflator is more favored in Europe and USA. While in China, most hospitals are equipped with middle and high flow insufflators. For the consumption of insufflator, it is expected the emerging market will have large growth rate in the future. Briefly speaking, in the next few years, insufflator industry will still be a highly energetic industry. Although sales of insufflator brought a lot of opportunities, the study group recommends the new entrants who just having money but without technical advantage and downstream support, do not to enter into the insufflator field hastily.
