This report studies the Intraosseous Infusion Device market. Intraosseous infusion is used to introduce any medications or solutions into the human bone marrow to offer an entry point in the systemic circulation. This technique is usually conducted when intravenous access is not available or not possible. This procedure is also used for vascular entry & for drug administration in adults and children. The infusion is usually introduced from proximal & distal tibia, sternum (FAST1), and humerus EZ-IO. The global intraosseous infusion devices market is growing steadily, mainly owing to a rise in the number of emergency medical cases and increase in the incidence of chronic disorders such as traumatic injuries, cardiovascular diseases, obesity, and severe burns that increases the probability of hospitalization.
