The global Intravenous Access Devices market was valued at 4107.84 Million USD in 2021 and will grow with a CAGR of 4.18% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Indwelling intravascular access devices (catheters) provide a route for: administering fluids, blood products, nutrients and intravenous medications; monitoring haemodynamic function; maintaining emergency vascular access; and obtaining blood specimens. Intravascular devices (IVDs) are catheters that are usually inserted into peripheral veins (e.g. small veins in the arms). Peripheral arterial devices are also used for some patients. Some central venous catheters are inserted through a peripheral vein site (peripherally inserted central catheters). They can be used for a prolonged period of time (e.g. for long chemotherapy(link is external) regimens, extended antibiotic therapy, or total parenteral nutrition). IVD insertion is the most commonly performed invasive healthcare procedure.
