Pheromones are chemicals produced as messengers that affect the behavior of other individuals of insects or other animals. They are usually wind borne but may be placed on soil, vegetation or various items. Each species of insect relies on some one hundred chemicals in its life, to engage in such routine activities as finding food and mates, aggregating to take advantage of food resources, protecting sites of oviposition, and escaping predation. It has been found that pheromones may convey different signals when presented in combinations or concentrations. Pheromones differ from sight or sound signals in a number of ways. They travel slowly, do not fade quickly, and are effective over a long range. Sound and sight receptors are not needed for pheromone detection, and pheromone direction is not limited to straight lines. Global IPM Pheromones key players include Shin-Etsu, BASF, Suterra, Isagro, Bedoukian Research, etc. Global top five manufacturers hold a share about 35%. North America is the largest market, with a share about 35%, followed by Europe and Asia-Pacific, both have a share about 50%. In terms of product, Sex Pheromones is the largest segment, with a share over 65%. And in terms of application, the largest application is Orchard Crops, followed by Field Crops, Vegetables, etc.
