A klystron is a specialized linear-beam vacuum tube. In a klystron, an electron beam interacts with radio waves as it passes through resonant cavities, metal boxes along the length of a tube. The electron beam first passes through a cavity to which the input signal is applied. The energy of the electron beam amplifies the signal, and the amplified signal is taken from a cavity at the other end of the tube. The output signal can be coupled back into the input cavity to make an electronic oscillator to generate radio waves. For the klystrons industry, the market is concentrated. L3Harris Technologies, Thales and CPI are the leading companies globally. The top five manufacturers has market share of 70.67% and they are working hard to expand their global distribution network.
