The global Kojic Acid market was valued at 34.88 Million USD in 2021 and will grow with a CAGR of 1.35% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Kojic acid with the chemical name 5-hydroxy-2-hydroxymethyl-4-pyrone is produced by several species of fungi, especially *Aspergillus oryzae*, which has the Japanese common name koji. It is a by-product in the fermentation process of malting rice, for use in the manufacturing of sake, the Japanese rice wine. ¹³C-Labeling studies have revealed at least two pathways to kojic acid. In the usual route, dehydratase enzymes convert glucose to kojic acid. Pentoses are also viable precursors in which case dihydroxyacetone is invoked as an intermediate. Kojic acid is a mild inhibitor of the formation of pigment in plant and animal tissues, and is used in food and cosmetics to preserve or change colors of substances. In general, it can also be concluded that glucose and yeast extract are the preferred carbon and nitrogen sources for kojic acid production by various fungal strains. And the main production base is located in China, which account for 73.45% in 2016.
