The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Laser micro perforation is a process of creating micro holes in the packaging materials of products. Micro perforation helps to control airflow and moisture release that ensures product freshness, leading to increased shelf-life. The controlled airflow helps in making the packages more compressed which reduces the shipping cost as the products can easily be stacked. Laser micro perforation also helps in generating a series of small holes on packaging to create a simple tear path. Traditional perforation punctures the flexible packaging films and leaves tears that take away from the aesthetics of the packaging. Laser micro perforation burns through the material, resulting in a cleaner, smaller, and more precise hole. Europe held the majority share of the global laser micro perforation equipment market in 2017.
