The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Laser phosphor is a lamp less projection illumination technology that is using blue laser diodes as the primary light source. The laser phosphor technology is powered by a combination of laser diodes, mirrors and a phosphor screen. These diodes direct a laser signal to the mirrors and these lasers are then projected onto the phosphor screen, stimulating the required RGB imaging sequence. It works basically like a laser printer, in which image is being refreshed at a much higher rate. Laser phosphor display is similar to cathode ray tube technology but it activates phosphors using lasers instead of electron gun. It is because of this the laser phosphor displays are never burdened with screen burn-in as compared with traditional display technologies. The growth in demand of laser phosphor display technology in video wall segment is mainly due to enhanced quality of image, decrease seam appearance, and promote sustainable practices. Laser phosphor technology displays help in providing displays of any shape, size and resolution allowing for innovative dynamic environments. Because the phosphor pixels have no electrical connections, so they do not experience mechanical or electrical failure. Based on the product type, the laser Phosphor Display Technology is primarily split into the Monitor Laser Phosphor Display Technology, the Projector Laser Phosphor

Display Technology and Others. The second kind is the main production type, accounting 98.71% of the sales volume market in 2019. Geographically, Asia-Pacific is the biggest part of the consumption market with 52.27% of the market sales share, followed by North America and Europe.
