Abstracts

The global LED street lighting market was valued at 24.35 Million USD in 2021 and will grow with a CAGR of 2.57% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

An LED street light is an integrated light that uses light emitting diodes (LED) as its light source. These are considered integrated lights because, in most cases, the luminaire and the fixture are not separate parts. In manufacturing, the LED light cluster is sealed on a panel and then assembled to the LED panel with a heat sink to become an integrated lighting fixture. Because LED technology is advancing so rapidly, utility companies and municipalities may have concerns that systems purchased today will become obsolete or will not be compliant with future upgrades. Reputable manufacturers however are making their LED street light offerings future-proof by designing them with replaceable modules that can be swapped out as technology improves. As well, the Department of Energy's model specification for roadway luminaires contains an optional clause that requires the luminaire/driver to be able to accept a control signal and dim for future control. Finally, once one community, utility or State successfully implements an LED street lighting system, it paves the way for others to follow.
