The global Light Emitting Diode (LED) Phosphor market was valued at 1100.6 Million USD in 2021 and will grow with a CAGR of 16.58% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Phosphor is a substance that displays the property of luminescence. In the case of LED lighting the type of luminescence is specifically fluorescence, the emission of light caused by the absorption of blue light energy emanating from the LED chip. When a phosphor absorbs a photon of blue light it emits a photon of longer wavelength, extending the spectrum toward the red. Different phosphors have different emission characteristics and thus when combined with the blue light and each other, a high quality light spectrum is produced. Phosphors are manufactured in ways to make them most suitable for consistent, high yield LED manufacturing. Most phosphors are packaged as powders of well formed, micrometer scale particles. These can be integrated into carrier materials that then coat and form LED components in many different ways.
