Lignin is the most abundant natural raw material available on Earth in terms of solar energy storage. It represents 30 per cent of all the non-fossil organic carbon on Earth. Lignin can be used as a green alternative to many petroleum-derived substances, such as fuels, resins, rubber additives, thermoplastic blends, nutra and pharmaceuticals. It is also known to be the only renewable source for industrial aromatics production. Lignin can be found in other plants, such as cereal straws, bamboo and bagasse, but it is in wood that lignin content is the highest in terms of weight: 20-35 percent in wood compared to 3-25 per cent in other lignin sources. Typically, kraft and organosolv lignins are two suitable candidates, whereas liginosulfonates will most likely lead to lower-value chemicals, which require more complicated processing. The lignin-based products demand with a fast growth rate in the past few years. The developed countries demand is relatively stable and the growth rate is relatively low. And the developing countries demand will increase in a relatively higher speed, especially in China, In 2017, global revenue of Lignin Products is nearly 750 M USD; the actual production is about 1300 thousand MT. Lignin Products can be broadly classified into three types: Kraft Lignin, Liginosulphonates and other, and the proportion of Liginosulphonates in 2017 is about

88.7%. Lignin Products is widely used in Construction, Animal Feed, Agricultural Industry and others. The most proportion of Lignin Products is used in Construction, and the consumption proportion is about 42% in 2017.
