Lithium Silicate is a dispersion of lithium silicate in water, tasteless, alkaline, translucent or transparent, commonly called lithium water glass. The product's density and viscosity change with its product types, relative density ranges 1.16~1.19(25°C). Lithium silicate is soluble in water and alkaline solution, insoluble in alcohol and organic solvent. It forms a sol when reacts with acid. It dries itself. After water is evaporated, it can produce a dry film insoluble in water, which is irreversible. It can react with substance with surface hydrophobic group and form a film, for example, it can react with the surface hydroxyl on the surface of glass, cellulose and form a film. Lithium Silicate is preferred to sodium and potassium silicates for many applications, including concrete surface treatments, specialty paints and coatings, welding rod binders, refractory, ceramics and glazes. Europe and North America are the main consumption regions of Lithium Silicate in the world in the past few years and it will keep the same position in the next few years. The market size of Asia-Pacific region will grow fast in the following years.
