The global Magnesium Hydroxide Flame Retardants market was valued at 50.72 Million USD in 2021 and will grow with a CAGR of 2.81% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography (North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Magnesium hydroxide is the inorganic compound. It occurs in nature as the mineral brucite. It is a white solid with low solubility in water. Magnesium hydroxide is a common component of antacids, such as milk of magnesia, as well as laxatives. Natural magnesium hydroxide is used commercially as a fire retardant. Most industrially used magnesium hydroxide is produced synthetically. Like aluminum hydroxide, solid magnesium hydroxide has smoke suppressing and flame retardant properties. It is a key player in the family of inorganic flame retardant. Magnesium hydroxide acts good flame retardant and smoke suppressant, and has been widely used many fields, such as plastics, rubber, coating and so on. Although magnesium hydroxide flame retardant has many substitutes, the products still achieves good growth in the past years. Magnesium hydroxide flame retardant has two manufacturing process, chemical synthesis and physical smash. For chemical synthesis, the technology is high and mastered by leading manufacturers from Japan, USA and Europe. As for the physical smash, magnesium hydroxide mainly gets from the brucite. Physical smashed magnesium hydroxide has lower quality than that from chemical synthesis. Presently, most of producers in China supply physical smashed type magnesium hydroxide flame

retardant to market. The quality offered by China local suppliers still has a gap with imported ones.
