The process of filtration involves the flow of water through a granular bed, of sand or another suitable media, at a low speed. The media retains most solid matter while permitting the water to pass. The process of filtration is usually repeated to ensure adequate removal of unwanted particles in the water. This type of slow filtration over a granular bed is generally known as slow sand filtration. It is the oldest method of filtration but still widely used today. More modern filtration systems use carbon as the main constituent material of the filter. This carbon is compressed into a solid block form, as opposed to the more loosely structured, granular, sand filters. Such filters often include other media substances, in addition to the compressed, solid carbon. This type of water filter is known as a multimedia filter. These filters clean water through both physical and chemical processes. Physically, they perform the same function as slow sand filters, blocking the passage of unwanted materials with molecular structures that are larger than water. Chemically, the carbon or multimedia filters perform an added filtration function. Through the process of adsorption, the atomic charge of the carbon and other media encourages unwanted particles to abandon their bond with the water and chemically attach to the media. The water then passes through the filter, cleansed

of undesirable materials. The addition of extra media to the standard filter constitution of sand or carbon allows for more particles to chemically bond to the media, resulting in greater filter performance and efficiency. Water is generally directed through several stages carbon and multimedia filters to ensure the removal of all unwanted materials. The first filtration stage will remove the most concentrated chemicals, like chlorine, while subsequent stages will remove smaller and more evasive chemicals, like pesticides. Currently, many players such as 3M, Brita, Marmon Water, Pentair, Culligan, Omnipure, AO Smith, Haier, Qinyuan, Midea as well as some others are playing important roles in Media Based Water Filters industry. The market is not so concentrated for now and is seeing to be more dispersed. There are many different types of Media Based Water Filters. The market can be segmented into: RO Based, Activated Carbon Based and Others. Activated Carbon Based is the most commonly used and efficient types and took 43.99% market share in 2019. By application, Home Use is the largest consumer group, with consumption market share of 59.77% in 2019. By installation type, Media Based Water Filters are mainly classified into the following types: Counter Top Type, UTS (Under the Sink) Type and Others. Counter Top Type is the most widely used type which takes up about 40.67% of the total sales in 2019.
