Morphine is a pain medication of the opiate variety which is found naturally in a number of plants and animals. It acts directly on the central nervous system (CNS) to decrease the feeling of pain. It can be taken for both acute pain and chronic pain. It is frequently used for pain from myocardial infarction and during labour. It can be given by mouth, by injection into a muscle, by injecting under the skin, intravenously, into the space around the spinal cord, or rectally. Maximum effect is around 20 minutes when given intravenously and 60 minutes when given by mouth, while duration of effect is 3-7 hours. Long-acting formulations also exist. The increasing prevalence of arthritis and cancer in geriatric patients is projected to impact the morphine market globally positively. The global medical morphine market is consolidated in nature owing to the dominance of few companies in manufacturing and processing. Morphine production is regulated by stringent regulation policies passed by several countries which would hamper its manufacturing. North America dominated the global medical morphine market and is expected to maintain its position in global market attributed to its increasing consumption in the U.S.
