Microdermabrasion is a mechanical exfoliation technique used to remove the outer most layer of dead skin cells. Microdermabrasion is a non-invasive procedure with no down time. The microdermabrasion treatment is used to decrease the appearance of superficial pigmentation and sun damage as well as diminish fine lines, wrinkles, and acne scars. This skin exfoliating process improves the tone and texture of the skin and reveals the new, living skin cells that are soft and smooth. Following medical microdermabrasion the skin is in a better condition to absorb anti-aging and acne creams. At the same time, the underlying epidermis is also stimulated by the treatment and this promotes new collagen, thickening the dermis and improving the resistance to the effects of aging
