Flotation is a predominantly used technique to separate mineral from ore, based on differences in ability of bubbles to bind with different minerals particle surface in a mixed slurry. Chemicals that are used for processing ores while producing minerals through flotation method are known as mining flotation chemicals, these chemicals largely include collectors, frothers, dispersants, activators, depressants and flocculants. Quality and volume of mining flotation chemicals varies according to type of ore. Among all chemical types, collectors accounted for largest pie in the global mining flotation chemicals market, representing over 25% of the total market revenue in 2017.
