Myelodysplastic (MDS) syndrome is a type of bone marrow disorder, where bone marrow is unable to produce healthy and mature blood cells. The immature blood cells called as blasts, get stored in the bone marrow and blood and obstruct the natural function of the hematological system which results in depletion of healthy red blood cells, platelets, and white blood cells. Myelodysplastic syndrome is usually seen in geriatric population and more often in older men than women. This syndrome is characterized by certain chromosomal mutations in Janus Kinase gene which include deletion of q arm in one or more chromosomes and complete deletion of chromosome 5 or 7 and an extra copy of chromosome 8. According to the American Cancer Society, the incidence rate for myelodysplastic syndrome is 13,000 new cases each year which happens at a rate of 4.8 cases per 100,000 people. This trend is heavily affected or rather influenced by the average age of the population which, according to the World Health Organization (WHO), is increasing and is expected to double from 12% to 22% between 2015 and 2050.
