Nanoclays are layered mineral silicates that are divided into various classes depending on their chemical composition and morphology. Commonly used commercial nanoclays include montmorillonite, bentonite, kaolinite, hectorite, and halloysite. Nanoclays are employed in the reinforcement of liquid silicone rubbers, fibers, polymer films, hybrid phenolic friction composites, and non-woven and other composite materials in polymer nanocomposites. Prices of nanoclay vary in each region. Hence, a similar volume-to-revenue ratio does not follow for each individual region. Regional average price has been considered while breaking down the market into product segments and end-users in each region.
