The global Negative Photoresist market was valued at 2327.65 Million USD in 2021 and will grow with a CAGR of 6.24% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

The positive photoresist resin is a kind of phenolic formaldehyde called a novolac resin, which provides the adhesion and chemical corrosion resistance of the photoresist. When no dissolution inhibitor is present, the novolac resin dissolves in the developer and is photosensitive. The agent is a photoactive compound, the most common being diazonaphthoquinone (DNQ). Negative resist refers to a short chain molecule of a polymer that crosslinks a long chain molecule due to illumination. The short-chain molecular polymer can be dissolved by the developer, so that the exposed portion of the positive gel is removed, and the exposed portion of the negative gel is retained.
