A network processor is an integrated circuit that is a programmable software device used as a network architecture component inside a network application domain. A network processor in a network is analogous to central processing unit in a computer or similar device. The replacement of analogous signals to packet data form in telecommunication has led to integrated circuits of network processors that handle data packets. Modern-day network processors have developed from simple designs to complex ICs with programmable software and a variety of operations and manipulation functions on the data packet. Network processors are employed in the manufacturing of routers, network switches, packet inspection, session controllers, firewall, transmitter devices, error detection and prevention devices and network control software. With today's web networking growing stronger than ever, network processors play a significant role in managing an overloaded network with abundant traffic and rapid growth rate. Network processors play a key role in packet inspection, encryption, monitoring, traffic management and queue management in a large network. The markets for network processors are intensely competitive, rapidly evolving and subject to rapid technological change. Currently, there are many vendors in the Network

Processors industry. The main market players internationally are Intel, Cisco, Broadcom, Cavium, Qualcomm, Ericsson, Mellanox ARM, Marvell, Fortinet, AMCC and etc... The R&D and Manufacturing locations are concentrated in China, USA, South Korea, Taiwan and some European countries. Top 2 player are Intel and Cavium, with above 30% market share. Taiwan is the biggest production areas for Network Processors, taking about 48% market share (based on revenue). China Mainland followed the second, with about 17% market share (based on revenue). In Consumption market, sales of Network Processor in Taiwan and China Mainland also occupied the most consumption market share, with 38% and 22% separately.
