The global Ophthalmic Femtosecond Lasers market was valued at .96 Million USD in 2021 and will grow with a CAGR of 5.46% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Femtosecond laser (FSL) is an infrared laser with a wavelength of 1053 nm. FS laser works producing photodisruption or photoionization of the optically transparent tissue such as cornea. The generation of short pulses is achieved using the passive mode-locking technique, which is used for generating pulses of light in extremely short duration (picosecond or femtosecond durations). The popularity of femtosecond lasers is rising among ophthalmologists as these devices help in simplifying and avoiding complex processes of open surgeries. The femtosecond laser uses ultrashort infrared laser pulses that are applied predictably and precisely with minimal collateral tissue damage to make it an ideal laser for highly precise ophthalmic surgeries. Vision loss is a serious problem among people suffering from glaucoma, cataract, age-related macular degeneration (AMD), and diabetic retinopathy. This commonly occurs among the geriatric population. American Academy of Ophthalmology stated that, around 1.3 million U.S. population are blind. Hence, in order to minimize such huge rate of vision loss, there is a high need for the application of ophthalmic laser technology.
