### Abstracts

The global Passport Reader market was valued at 165.78 Million USD in 2021 and will grow with a CAGR of 4.76% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

A biometric passport is a traditional passport that has an embedded electronic microprocessor chip which contains biometric information that can be used to authenticate the identity of the passport holder. It uses contactless smart card technology, including a microprocessor chip (computer chip) and antenna (for both power to the chip and communication) embedded in the front or back cover, or center page, of the passport. The passport's critical information is both printed on the data page of the passport and stored in the chip. Increase in the e-passports is rising the demand for passport readers at the airport terminals, hotels, and car rental service stations among others. These e-passports help in creating highly secure and interoperable infrastructure for international travel. Additionally, they reduce waiting time and benefit users by providing self-service kiosks, which enables the passengers to self-verify. However, one of the major restraining factors slowing down the growth of the passport readers market are the technical issues that occur in the device. The passport reader is an electronic device comprising electronic components, optical scanners, RFID, and others. Electronic components are highly sensitive to high voltage, which may damage them or may interfere with the proper working of the device.
