Patient fluid status monitor device generally refers to device used clinically to measure hydration in a patient, to determine whether or not the patient is dehydrated or retaining fluids. By quantifying fluid volume status, clinicians can optimize medical regimens and hydration critical in the management of heart failure patients; besides, patient fluid status monitor device can also be used in the treatment of hypertension patients and ESRD patients. The downstream customers of patient fluid status monitor device products are hospital, clinic and personal-use. In the recent years, with the recovery of global economic, the development of emerging countries and the growth of medical expense, the consumption increase of patient fluid status monitor device will be obvious. In the foreseeable future, the patient fluid status monitor device products will show an optimistic upward trend. Although sales of patient fluid status monitor device products bring a lot of opportunities, the study group recommends the new entrants who just have money but without technical advantage, raw materials advantage and downstream support, do not enter into the patient fluid status monitor device field hastily.
