Desiccant tablets are used as another way to control the moisture and humidity inside the packaging of pharmaceutical tablets and capsules. It works effectively in removing the moisture from the top surface of the container or bottle when they are being packaged. The principal desiccants used in pharmaceutical applications are silica gel and molecular sieve. Silica gel is available in two main types: a white, non-indicating version and one that changes colour when moisture is adsorbed. The latter is obviously useful to indicate when the desiccant is used up. Self-indicating gels also have a number of varieties, the older blue-to-pink gels and the more recent yellow-to-green ones. Blue-to-pink gels contain cobalt chloride so are subject to legislation in Europe that requires a toxic hazard label. Yellow-to-green gels do not pose such health and safety issues. White-to-pink gels are also available but these contain phenolphthalein, a known carcinogen. Molecular sieve is a special type of desiccant that can reduce moisture levels to almost zero. Such desiccants are available in different pore sizes with varying capacities for moisture adsorption. Activated carbon, while not a desiccant, is often used to absorb odours.
