The global Phosphorescent Pigments market was valued at 78.56 Million USD in 2021 and will grow with a CAGR of 5.6% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Phosphorescence pigment is a specific type of photoluminescence related to fluorescence pigment. Unlike fluorescence, a phosphorescent material does not immediately re-emit the radiation it absorbs. Usually, the short persistence phosphorescent pigment takes zinc sulfide as base and copper as activator. While, for long persistence phosphorescent pigment, alkaline earth aluminate or alkaline earth silicate will be the base and rare earth ions become the activator. Generally, phosphorescent pigment can be broadly categorized into two types: short persistence phosphorescent pigment and long persistence phosphorescent pigment, based on the glowing time. Production of long persistence phosphorescent pigment accounts for the largest market share, with 66% market share in 2016. Since the synthesis of the strontium aluminate phosphor, a phosphor far exceeding the traditional sulfide phosphor in brightness, persistent time, and chemical durability, new non-radioactive long lasting phosphor materials received rapidly growing interest, especially the rare-earth-doped alkaline-earth aluminates. In the future, the market share of long persistence phosphorescent pigment will continue to increase. Phosphorescent pigment is a kind of pigment, which is different from fluorescent pigment in essence. Zinc sulfide or alkaline

earth aluminate/alkaline earth silicate is usually chosen as the base of phosphorescent pigment while copper or rare earth is chosen as activator accordingly. Phosphorescent pigment can be used in indicator & marker, home appliance & electronic parts, paints & coatings, writing & printing inks, textile as well as other industries. Globally, in 2016, 35.80% of phosphorescent pigment was consumed during the manufacturing of indicator and marker, while 21.26% and 17.67% were respectively consumed in home appliance & electronic part as well as inks.
