## Abstracts

The global Polymer and Thermoplastic Micro Molding market was valued at 614.58 Million USD in 2021 and will grow with a CAGR of 11.31% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Micro injection molding, as the name suggests, is a molding process which requires a specific molding machine with high injection pressure and speed, precise shot control, and ultra fine resolution for molding small sized tools and parts. This technique is used for the development of small or micro products that require precise specifications. Micro injection molding is usually done for the parts that are designed with weight less than a milligram and size less than 1mm. Use of this technique is not limited to only small parts but may be used for large products which require micro sized features such as thickness, diameter hole, etc. Silicone is the major raw material used for micro molding, owing to its physical and chemical properties. However, silicone is costly and impacts the profitability of molders. In order to reduce manufacturing cost, polymers came into existence in the 90s. Polymer based micro molded products find applications in almost all of the application areas where silicones are being used. Polymers are further classified as thermosets, thermoplastics and elastomers out of which thermoplastics are majorly used for various applications in end-use industries.
