The positive photoresist resin is a kind of phenolic formaldehyde called a novolac resin, which provides the adhesion and chemical corrosion resistance of the photoresist. When no dissolution inhibitor is present, the novolac resin dissolves in the developer and is photosensitive. The agent is a photoactive compound, the most common being diazonaphthoquinone (DNQ).Photoresist is highest technical barriers material in electronic chemicals. It required high purity requirements, complicated production process, large investment in equipment such as production and testing, and long technology accumulation period. The global market is basically monopolized by several large enterprises in Japan, the United States, Taiwan and other countries and regions, such as Japan Synthetic Rubber (JSR), Tokyo Yinghua (TOK), Sumitomo Chemical, DuPont, Taiwan Changxing, etc., and the market concentration is very high. high. Positive resist refers to a long-chain molecules of the polymer by exposure to light cut into short chain molecules.
