Aluminium Tri Hydrate (ATH) is an inorganic white fine crystalline, non-hygroscopic powder. Its solubility in water and organic solvents is very low. By volume, ATH is the largest flame retardant (FR) used in diverse end applications. The working principle is based on the thermal decomposition of aluminium hydroxide into aluminium oxide and water(vapour). This endothermic reaction starts at about 200 °C and consumes energy from the ignition source. The generated water vapour cools the polymer surface and dilutes the concentration of burnable gases in the surroundings. The remaining metal oxide residue has a high internal surface where sooty particles, respectively polycyclic aromatic hydrocarbons, are absorbed, making ATH also a smoke suppressant. The oxide layer acts as a barrier protecting the polymer against further decomposition. Global Precipitated Alumina Trihydrate key players include Huber, AL-TECH, CHALCO Shandong, etc. Global top 3 manufacturers hold a share over 50%. Asia-Pacific is the largest market, with a share about 60%, followed by Middle East & Africa and Europe, both have a share over 15 percent. In terms of product, 1-1.5µm is the largest segment, with a share over 45%. And in terms of application, the largest application is Flame-retardant Filler & Smoke Suppressants, followed by Filling Material
