Presbyopia Correction Device general has two types: corneal inlay and scleral implants. A corneal inlay (also called an intracorneal implant) is a device which is surgically implanted in the cornea of the eye as a treatment for presbyopia. Successful installation results in reducing dependence on reading glasses, so that the user can more easily engage in everyday tasks such as using a mobile phone, reading store shelf prices and working on a computer. Corneal inlays are small, thin, and permeable. Typically one is implanted in the non-dominant eye. Scleral implants are precision-molded from a clear plastic material; the clear implants are about the size of a grain of rice and are placed just below the surface of the white of your eye (called the sclera). The only one commercially available is VisAbility? Micro-Insert System. The classification of presbyopia correction device includes corneal inlays, scleral implants, and the proportion of corneal inlays in 2017 is about 82%. Presbyopia correction device is widely used for the presbyopia patients. And according to the patients` age, the device can be divided to age 40-50, age 50-65, age above 65. The most proportion of presbyopia correction device is 50-65 years old patients, and the proportion is about 53%. EU is the largest consumption place, with a consumption market share nearly
