## Abstracts

The global Pressure Vessel Composite Materials market was valued at 1436.76 Million USD in 2021 and will grow with a CAGR of 4.74% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography (North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Pressure vessel composite materials are used in manufacturing pressure vessels that are used to store gases and liquids under high pressure. Pressure vessel composite materials are mainly used for LPG, reverse osmosis systems and hydrogen storage. A growing and likely huge, sustainable market for pressure vessels is the growing construction of seawater reverse osmosis (SWRO) desalination plants. SWRO depends on membrane systems that serially cleanse water piped onshore from the ocean. These membranes must be encased in membrane housings. Filament-wound fiberglass pressure vessels are used almost exclusively for this purpose today, in quantities of as many as 6,000 per desalination plant. Linerless, all-composite pressure vessels, which fit the more recent and radical Type V classification and are best able to reduce mass in weight-sensitive applications, are the goal for a number of pressure vessel manufacturers. In the future, hydrogen energy will increasingly occupy more market share, and Type V pressure vessel will maintain rapid growth.
